

Butterfly Images of Kathmandu Valley

KATHMANDU • LALITPUR • BHAKTAPUR

2026

A Mobile Book

6 Families • 174 Species • 503 Images

Greenalaya Nepal & TinyLife Finders

About this PDF

This mobile book (PDF) is specially designed for read on Smartphone and Tablet which are easy and comfortable to carry everywhere on field visit or observation. Portable Document Format (PDF) is a common and easy file format for all kinds of portable devices these days. Here is brief information about this this PDF.

This PDF includes

Total Butterfly family	6
Total Butterfly Species	174
Total Butterfly Images	503
Total Observed Locations	34
Total Hotspots	6
Total Useful Graphics	4
Total Photo Contributors	10

This PDF is also printable on universal print paper from home and commercial printers. Its added 0.5” gutter margin for paper binding.

Paper standard – A4 size

Left side Paper margin – 0.5”

Binding margin (gutter) – 0.5”

Gutter position – Left (with total 1” margin)

- This is OCR (Optical Character Recognition) PDF so it is easy to search specific word.
- Special quality maintained to zoom view on smartphone.

Cover Page image – Blue Pansy (Ruman Shrestha)

Back Page image – Red Lacewing (Shalik Ram Sapkota)

Graphics – Graphics no. 1, 2, & 3 – Ruman Shrestha

– Graphic no. 4 – Binit Timalisina

ISBN: 9789905-0-0219-7

Preface

Dear Readers,

Namaste and welcome to this Mobile Book on the **Butterfly Images of Kathmandu Valley**.

Butterflies are among the most beautiful and charming creatures in nature. Whether fluttering around our homes, gardens, farms, open fields, or forests, they naturally draw our attention. Many of us pause in admiration and say, “Wow! What a beautiful butterfly!”— often calling others to share the moment. In recent years, photographing butterflies and sharing them on social media has also become increasingly popular.

Biologically, Butterflies belong to the class Insecta and the order Lepidoptera. Beyond science, they have long held cultural and spiritual significance; in many ancient beliefs, Butterflies were regarded as messengers of God and symbols of transformation, admired with deep reverence.

We frequently noticed friends and nature enthusiasts sharing butterfly photographs on their social media platform without information about the species itself. While this practice helps raise awareness and appreciation, photographs without identification limit their educational value. Curious readers may wish to know the species name, its locality, or want to dwell about its key characteristics. Providing such information not only enriches the photograph but also transforms it into a useful reference for learners, researchers and butterfly enthusiasts. This realization became the foundation for creating this Mobile Book.

To make the content more practical and accessible, we chose a digital format that can be easily viewed on smartphones, especially during outdoor observations. Because of its portability and ease of use, we proudly call this creation a **Mobile Book** which is right now in your hands.

Nepal is home to approximately 695 recorded species of butterflies, of which nearly 360 species have been documented from Kathmandu Valley (Kathmandu, Bhaktapur, and Lalitpur). With continued observation and documentation, this number is expected to increase. This Mobile Book presents photographs of butterflies representing diverse morphologies, along with their common and scientific names, date and location of observation, and due credit to the photographers.

This Mobile Book (PDF) will be updated and released twice a year. A general updated issue will be published in the first week of July (from next year), while an annual revised version will be released in the first week of January. Newly photographed butterfly species from Kathmandu Valley will be incorporated into both the regular updates and the annual edition.

We hope this Mobile Book (PDF) inspires curiosity, learning, and conservation awareness among readers.

Thank you!

Greenalaya Nepal and TinyLife Finders

April 2026, Kathmandu

Acknowledgements

This Mobile Book on the **Butterfly Images of Kathmandu Valley** is the result of a collaborative effort driven by curiosity, passion for nature, and a shared commitment to documenting butterfly richness. The project would not have been possible without the encouragement, knowledge, and contributions of many individuals.

We extend our sincere gratitude to all butterfly enthusiasts, photographers, and nature observers who generously shared their valuable photographs, field observations, and supporting information. We are especially grateful to the supporters of Greenalaya Nepal and the TinyLife Finders for their enthusiasm, collaboration, and continuous encouragement throughout the preparation of this document. Their dedication to biodiversity awareness and conservation has been instrumental in bringing this initiative to life.

We also sincerely acknowledge Mahendra Singh Limbu, Bimal Raj Shrestha, Sanej Prasad Suwal and other experts for sharing their expertise in Lepidoptera and for their valuable support in identifying and confirming butterfly species. We're very grateful to have Mahesh Bajracharya and Prasan Shrestha for their significant contribution through photographs. We are equally grateful to researchers, field naturalists, and authors whose earlier works, field guides, and scientific documentation butterflies have served as important references and inspiration for this publication.

Finally, we extend our appreciation to everyone who supports nature observation, citizen science, and biodiversity documentation in Kathmandu Valley. We hope this Mobile Book encourages more people to observe, photograph, identify, and conserve butterflies and their habitats.

Thank you!

Greenalaya Nepal and TinyLife Finders

April 2026, Kathmandu

About Greenalaya Nepal and TinyLife Finders

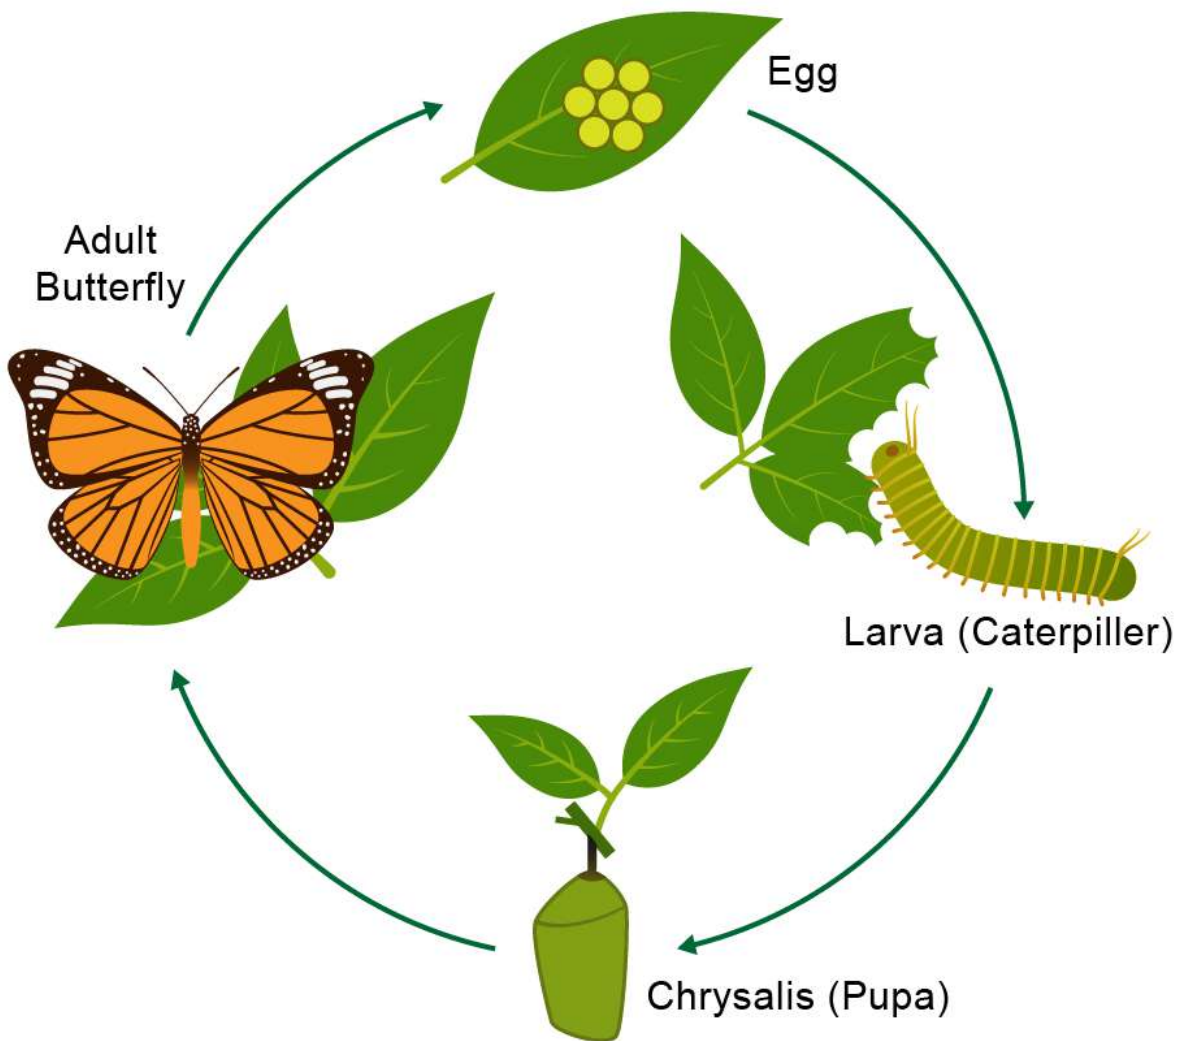

Greenalaya Nepal is a national environmental NGO that integrates research, technological innovation and green enterprise to deliver data-driven solutions for building resilient ecosystems. Through collaborative approaches, the organization works to bridge people, nature and technology. It envisions a resilient Nepal where empowered communities actively conserve and restore ecosystems while fostering sustainable and innovative green enterprises in harmony with nature.

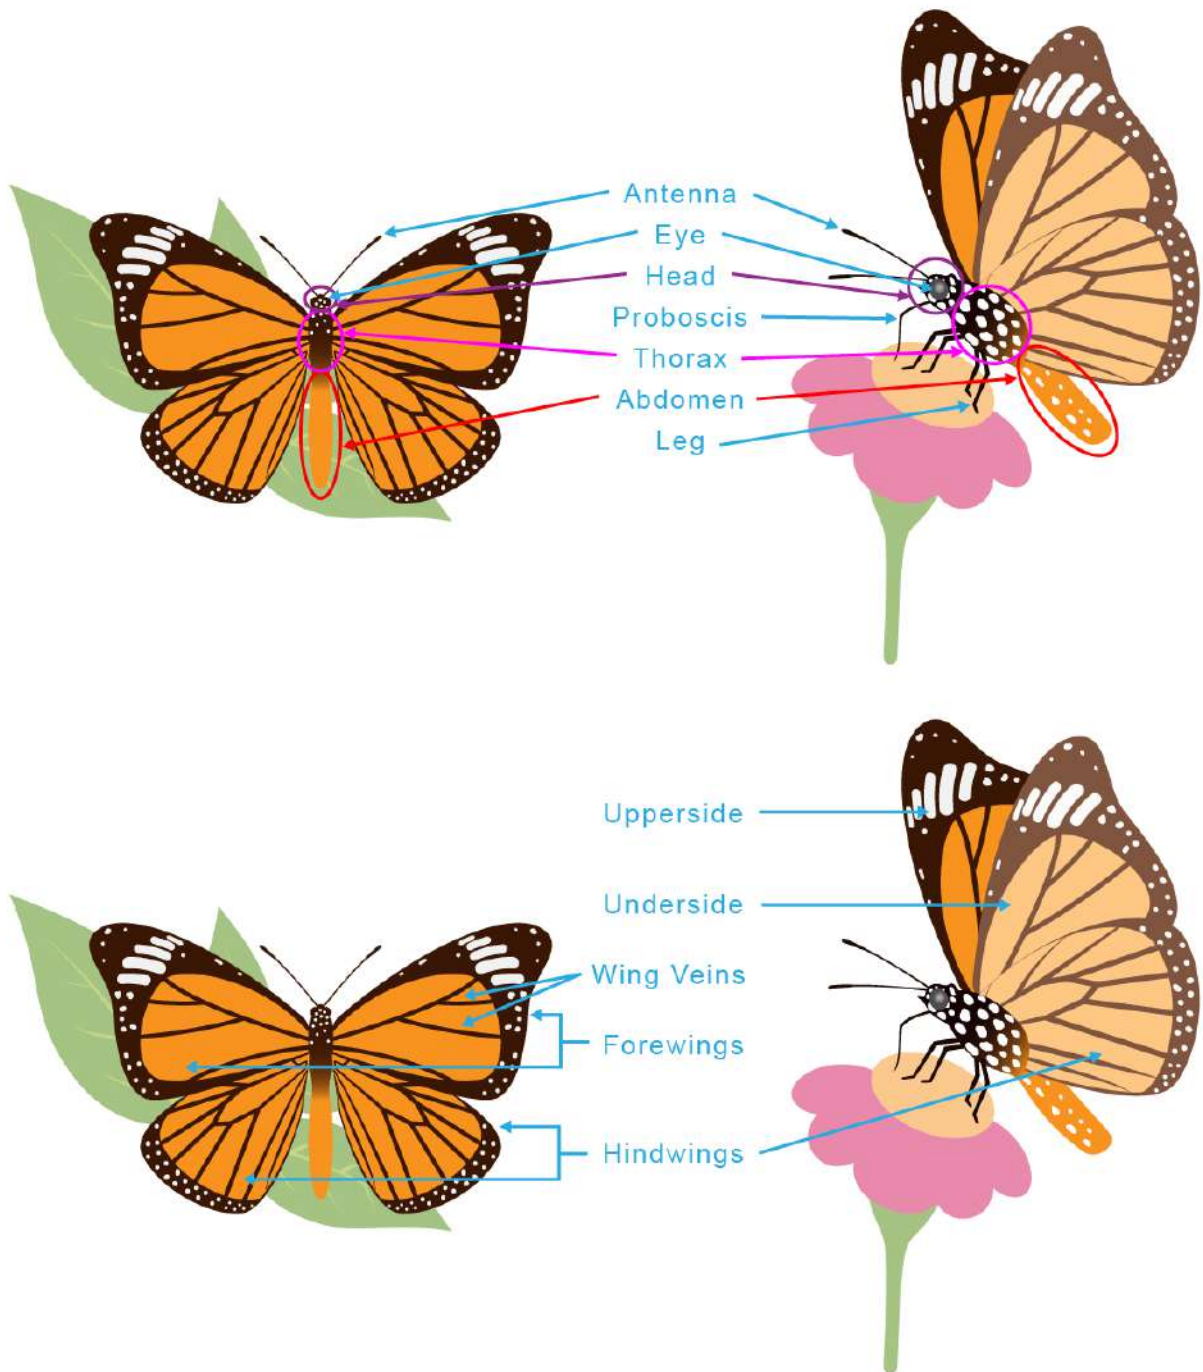

TinyLife Finders is a small group of nature enthusiasts who enjoy observing and documenting the beauty of nature with a special focus on small and often overlooked life forms. Their shared interest has created a strong bond among members to explore, understand and document these miniature forms of life without disturbing their natural habitats. The group documents and photographs butterflies, moths, bees, beetles, birds, flowers, plants, and other small creatures that together make this living Earth diverse and vibrant. Through photography, observation and documentation, the group aims to promote awareness and appreciation for biodiversity, especially the tiny life forms that are often ignored but play significant roles in ecosystems.

Hesperiidae (Skippers)

Skippers have a robust thorax and different antennae than other butterflies. Unlike the 'clubbed' antennae of butterflies, skippers have hooked antennae tips so they are easy to identify from other butterflies. They have quick response and fly fast in short distance. Most skippers are brown, gray or dusky yellow having white or orange marking.

Lycaenidae (Gossamer-Winged)

Butterflies under Lycaenidae family are usually small and quick responsive than other butterflies. It's so hard to approaching them to observe or photograph nearly. The name 'gossamer-winged' refers to wings that are extremely light, thin delicate and semi-transparent. They're difficult to observe closely, tricky to photography and challengeable to identify.

Nymphalidae (Brush-Footed)

This family is the largest family among other 6 butterfly families. It includes highest number of butterfly species. Simply, brush-footed means hairy leg which looks like a paintbrush. They have total 6 legs but appear to have just two pairs (four) of legs. The first pair is reduced in size that's why they're also called four-footed butterflies. Reduced front pair of legs are used to taste their food.

Papilionidae (Swallowtails)

Papilionidae family of butterfly are also known as swallowtails. Swallowtails are usually bigger and variety in wing shapes. The common name 'Swallowtail' refers to the tail-like appendages on the hindwings of many species in this family. All swallowtail butterflies do not have tails but could still be a swallowtail. Likewise, some butterflies couldn't include in this family even they have tail or looking such kind of parts on their hindwings.

Pieridae (Whites and Sulphurs)

The Pieridae family also known as the white and sulphurs because most of them have pale white or yellow wings with markings in black and orange. They're small to medium size butterflies. Butterflies of pieridae family also have 3 pairs of similar legs, unlike the 'brush-footed' with their shortened front legs. This family has limited range of species.

Riodinidae (Metalmarks)

Butterflies of Riodinidae family also called Metalmarks. They get their name from the metallic-looking spots commonly found on their wings. Metalmarks are small to medium in size. The wing shape is very different within the family.

Appeal

Hi everyone, if you love Butterflies please give some sympathy to those Caterpillars too. Do not hate them. Do not throw away from garden plants or flowers pot. Do not let your kids to kill them. No pesticides. Let them eat few plant leaves for a few days. They need more food and nutrition to grow fast and transform from caterpillar to Chrysalis or Pupa stage of their life cycle. They become leaf-muncher or foodie in caterpillar stage so they consume massive amounts of leaves to fuel exponential growth and store energy for metamorphosis. Let them eat, wait some days then they become beautiful butterflies.

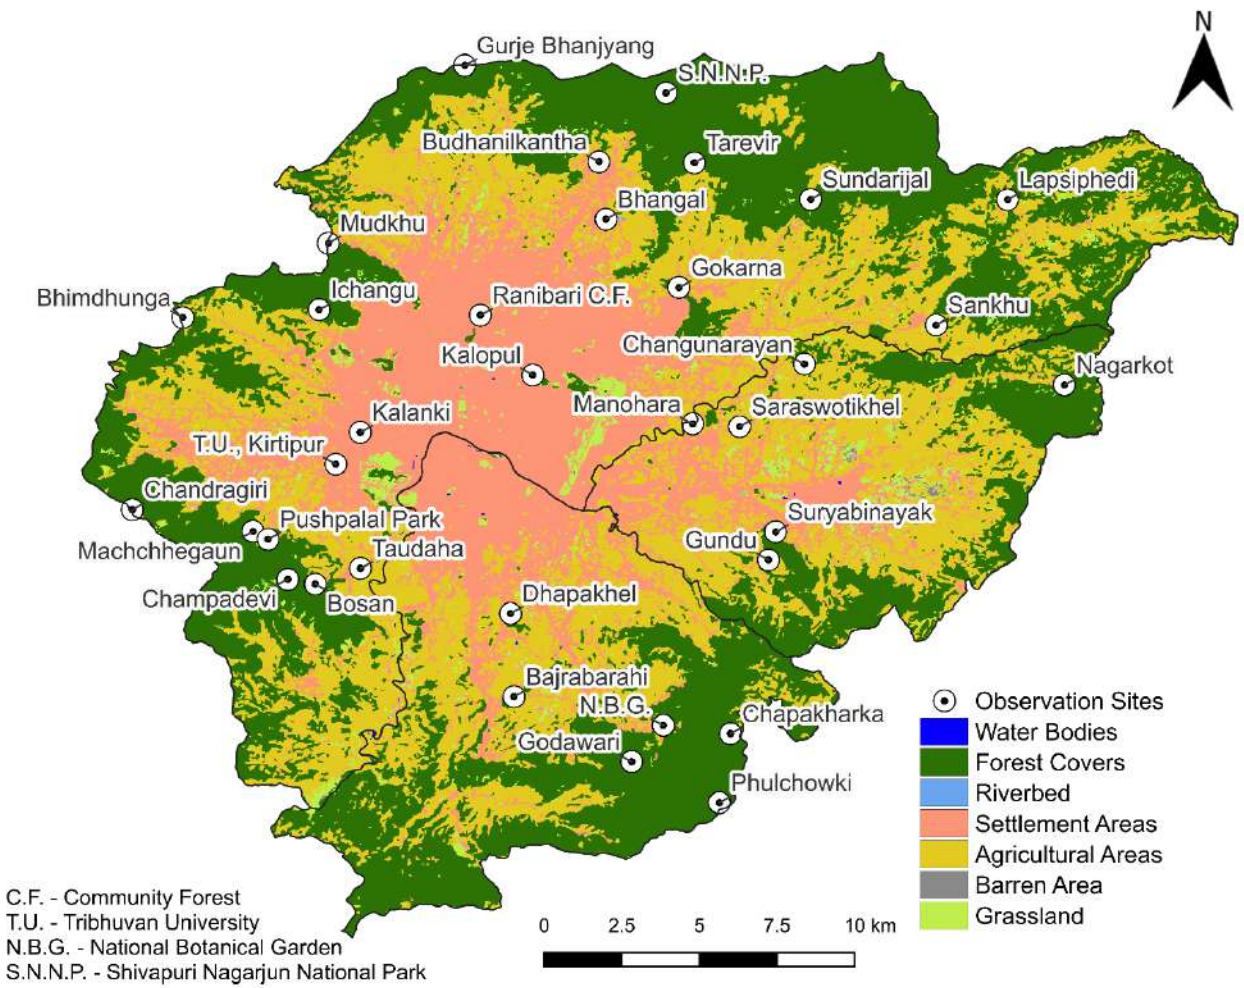

Be happy to watching them and take photos, enjoy!
